WORK ACTIVITY

PROJECT DETAILS

Name:

Address:

Prevention of falls using the hierarchy of controls when working at heights.

SCOPE OF WORK COVERED BY THIS SAFE WORK METHOD STATEMENT

The Working at Heights Safe Work Method Statement (SWMS) outlines the main hazards and risks associated with working at heights in all workplaces in all States and Territories including the risk of falls, falling objects, and use of height access plant and equipment.

The SWMS provides details of the safety precautions (including provision of fall protection and fall prevention devices and personal protective equipment requirements) to be observed when working in any situation where a person may be harmed by a fall from one level to another.

GENERAL INSTRUCTIONS FOR SAFE WORK METHOD STATEMENTS	SITE SPECIFIC CONSIDERATIONS
A safe work method statement (SWMS) must be prepared for any and all high risk construction work to be undertaken prior to the work commencing. All high risk construction work must be carried out in accordance with this SWMS.	NOTE: This is a generic SWMS. A generic SWMS may be prepared and used for high risk construction work activities that are carried out on a regular basis; however, the generic SWMS must be reviewed by the person carrying out the work to take into account the hazards and risks for the specific workplace and amend the SWMS
This SWMS must be kept and be available for inspection until the high risk construction work to which this SWMS relates is completed. If the SWMS is revised, all versions should be kept. If a notifiable incident occurs in relation to the high risk construction work in this SWMS, the SWMS must be kept for at least 2 years from the date of the notifiable incident.	as necessary for the site where the work is to be carried out, and complete details such as names and qualifications of workers who will carry out the work. All amendments to the SWMS must conform to regulatory requirements and be recorded on the SWMS. Workers and their health and safety representatives (if any) should be consulted before the generic SWMS is first made available to them and all workers instructed in the SWMS by site-specific inductions or toolbox take. Details of consultations with workers and instruction in the SWMS
The PCBU or employer must ensure, so far as is reasonably practicable, that the information, training and instruction is provided in a way that is readily understandable by any person to whom it is provided.	must be recorded on the SWMS for that project or site. All workers are required to sign-off on the SWMS before the work is commenced.

Working at Heights SWMS

HIGH RISK CONSTRUCTION WORK ACTIVITIES (CHECK ANY THAT ARE APPLICABLE TO WORK COVERED BY THIS SWMS)

х	A risk of a person falling more than 2 metres (or 3 metres in SA)	Demolition of a load-bearing structure		Work on a telecommunications tower
	Work in or near a shaft or trench with an excavated depth over 1.5m; or in a tunnel	Temporary load-bearing support structures		Work on or near pressurised gas distribution mains or piping
	Work in an area at a workplace in which there is any movement of powered mobile plant	Work involving the use of explosives		Work on or near chemical, fuel or refrigerant lines
	The disturbance of or likely disturbance of asbestos	Tilt-up or precast concrete		Work in an area in which there are artificial extremes of temperature
	Work on or near energised electrical installations or services	Work on, in or adjacent to a road, railway, shipping lane or other traffic corridor used by traffic other than pedestrians		Work on, under or near water or other liquid that involves a risk of drowning
	Work carried out in or near a confined space	Work in an area that may have a contaminated or flammable atmosphere		Diving work

RISK CONTROL	Actions to be taken to control risks	What m
Hierarchy of risk controls (in order of preference)	How will risk controls be implemented?	Check a
1 Elimination (most effective)	Eliminate the hazard and the associated risk	Respons
2 Substitution	Substitute the hazard with something safer	Site-spe
3 Isolation	Isolate the hazard from people (e.g., barrier, wall)	SWMS p
4 Engineering means	Physical controls including guards, mechanical devices	Ongoing
5 Administrative controls	Work methods or procedures to minimise exposure	Monitori
6 PPE (least effective)	Provide protective clothing and equipment to workers	SWMS of

Job activity	Hazards and associated risks	How will the hazards and the risks be controlled?
Inductions and training	Untrained workers	All persons working on a construction site must hold a General Construction Induction (GCI) card. Carry out site-specific inductions for all workers. All workers must be competent in the tasks carried out. Vehicles, plant and equipment must only be operated by licensed or competent persons.
	Working at heights	All workers required to work at heights will have completed the Unit of Competency RIIWHS204A – Work safely at heights (or equivalent). Persons working in elevating work platforms (EWP) such as boom lifts and scissor lifts will be instructed in emergency procedures including rescue procedures to be followed in the event of a person falling from the platform.
Site security	Unauthorised entry to site	Provide security fence, safety barricades, etc., around work site, and post warning signs at entrances to site. All plant, materials and tools must be inside barricaded areas. Site must be secured from entry when unattended.
Public safety	Personal injury	Provide safe access for pedestrians past work site. Provide protection for pedestrians from falling objects (e.g., containment screens on scaffolds, gantry, etc.). Do not lift or suspend loads over pedestrians or vehicles on footpath or roads.
Traffic	Collisions	Provide safe parking for vehicles on site where practicable. Use traffic control when working on or near roadways, or during delivery of materials or delivery or removal of plant. Wear high-visibility clothing when working in or near roadways and traffic.

Job activity	Hazards and associated risks	How will the hazards and the risks be controlled?	
Hazardous manual tasks	Strains, personal injury	Provide sufficient personnel or mechanical aids to handle and move large, heavy or awkward loads. Provide safe means of transporting and moving loads on site to minimise manual movement of heavy items. Provide manual handling training to all persons.	
Electrical hazards	Electrocution Ensure that safety switch is provided on switchboard, and check operation before		
	Electrical tools and equipment	All electric tools and equipment will be inspected, tested and tagged every 3 months and before use on construction work. Keep electric leads off ground to protect from damage.	
		Inspect tools and check operation of controls daily before use. Faulty electric tools will not be used.	
	Overhead electricity lines	Maintain safe approach distance from energised electricity cables when erecting or working on scaffolds. Consult supply authority if work carried out will be placed at risk due to presence of electricity installations.	
High risk work licenses	Unauthorised or unsafe operation	Only those persons who hold the appropriate Class of licence are to carry out high risk work, including dogging and rigging work, crane and hoist operation, scaffolding work, and forklift operation.	
Preventing falls	Hierarchy of controls	The hierarchy of controls specified in regulations should be applied to all work at heights where there is a risk of a person falling. Regulations require duty holders to select the control that most effectively eliminates or minimises the risk in the particular circumstances.	
		adequate protection.	
		In some cases, a combination of control measures may be necessary.	
	Risk assessment	A generic risk assessment may be applicable to different work areas where the same fall hazards exist; however, individual risk assessments should be made where greater, additional or different risks are present.	
Work on ground or a solid construction	Work on ground	Carry out as much work as possible on the ground to eliminate the risk of falling from heights. Assemble items on ground to reduce amount of work carried out at heights.	

Job activity	Hazards and associated risks	How will the hazards and the risks be controlled?			
	Work on solid construction	Solid construction means an area that is structurally capable of supporting any loads placed on or applied to it, and that is provided with barriers around its perimeter and around or over openings through which a person may fall. A safe means of access and exit for workers must be provided. Gates in barriers should be of a type that will prevent persons from accessing edges while allowing items to be placed or removed on the level			
	Perimeter guard rails	 Perimeter guard rails to prevent a person falling over edges and into holes should be provided on relevant par of a solid construction including: the perimeters of buildings or other structures (including roofs) mezzanine floors openings in floors, or the open edge of a stair, landing, platform or shaft opening. 			
		Effective fall prevention must be provided at the edge of roofs, floors, walkways, etc., and other locations where a fall of a person is likely. Perimeter rails must be designed and erected by a competent person.			
Fall prevention devices	Temporary work platforms	A temporary work platform is a working platform used to provide a fixed working area for the duration of the work being carried out.			
	Scaffolds	All scaffolds from which a person or object can fall more than 4 metres must be erected, altered and dismantled by or under the direct supervision of a licensed scaffolder.			
		Scaffolding work for which a specific class of high risk work licence is specified must only be carried out by a person who holds the required class of licence for the work to be carried out.			
		A person who erects, alters or dismantles a scaffold where there is a risk of a person or object falling 4 metres or less from the platform or structure does not require a high risk work licence; however, the person must be competent in the work and follow supplier's instructions for its safe use.			
	Trestle ladder scaffolds	Trestles must be placed on a firm stable surface and prevented from slipping while in use.			
	Working platforms	Working platforms must be at least 450mm wide and have a non-slip surface with guardrail, midrails and toe board or mesh infill to prevent persons or objects falling from the working platform.			
		Ends of working platforms must be guarded to prevent a person falling from the ends of a platform.			
		Do not overload work platforms beyond the rated capacity of the platform or scaffold components.			

Job activity	Hazards and associated risks	How will the hazards and the risks be controlled?		
	Boom lift	A high risk work licence (Class WP Boom lift over 11m) is required to operate a boom lift with a boom greater than 11 metres in length. A HRW licence is not required to operate a boom lift with a boom length of 11 metres or less; however, the person must be formally trained and assessed as competent in the use of the equipment.		
	Scissor lift	A HRW licence is not required to operate a scissor lift; however, the person must be formally trained and assessed as competent in the use of the equipment.		
	Forklift workbox	A licence is not required for work in a forklift workbox; however, persons working in a forklift workbox should be trained in safe working at heights. Forklifts must only be operated by a person who holds a HRW licence (Class LF Forklift truck).		
	Crane workbox	A licence is not required for work in a crane workbox; however, persons working in a crane workbox must be trained in safe working at heights.		
	The crane must be operated by a person who holds the appropriate HRW licence for			
work positioning systems	Restraint technique	where there is a risk of a fall. It consists of a safety harness attached by a lanyard to an anchorage or static line.		
Fall arrest systems	Arrest systems Individual fall-arrest systems Fall arrest systems comprise a safety harness worn by a worker attached arrestor attached to an anchorage designed to withstand the shock loadir falling.			
	Catch platforms and safety nets	Catch platforms are placed below a work area to catch a worker or object in the event of a fall. The platform must be designed to withstand the maximum potential impact load.		
		Safety nets can provide satisfactory protection while allowing workers maximum freedom of movement. Safety nets must conform to relevant Standards and be erected by a competent person.		
Use of ladders	Falls of persons from ladders	I ladders Ladders are to be an industrial type with a 120kg rating. Do not use domestic ladders in a workplace. Always face ladder, and climb or descend slowly. Do not carry anything in the hand while climbing or descending.		

Job activity	Hazards and associated risks	How will the hazards and the risks be controlled?	
	Single or extension ladders	Ladders should be used for access only except for light work which can be carried out with one hand. Ladders should extend 1 metre above level being accessed and must be secured against movement.	
	Stepladders	Step ladders must be opened fully, and brace locked in place. All feet must be in good contact with a firm, stable surface. Do not stand on top two rungs of step ladder, on top of the step ladder, or on the rear horizontal braces.	
	Platform ladders	Folding platform ladders must be opened fully and braces locked in position before use. All feet must be in contact with a firm, stable surface. All treads and platform surfaces must be clean and dry.	
Temporary work platforms	Portable work platforms	Folding portable work platforms must be at least 450 mm wide with a non-slip surface on the platform. The platform must be opened fully and braces locked in position before use. All feet must be in contact with a firm, stable surface. All treads and platform surfaces must be clean and dry.
